Education

BITS Pilani — Jan 2026 – Dec 2027 (expected)
M.Tech. Machine Learning and Artificial Intelligence (Work Integrated Learning Programme) — *Remote*

IIIT Delhi — 2019 – 2023
B.Tech. Computer Science and Engineering, CGPA: 8.34 — *New Delhi, India*

Stanford University (Online) – AI Technical Professional Certificate — 2026
Deep Reinforcement Learning, Reinforcement Learning, Deep Generative Models — *Remote*

Technical Skills

Languages: C++, C#, Python, TypeScript, JavaScript, KQL, SQL
Technologies: Azure, AWS, GCP, .NET, Azure DevOps, Azure AI Foundry, PyTorch, React.js, Node.js, REST APIs, Git
AI/ML: Generative AI, Large Language Models (LLMs), LLM Evaluation, AI Agents, Model Context Protocol (MCP), A2A
Areas: Distributed Systems, Cloud Infrastructure, Authentication & Security, Observability
Coursework: Mathematical Foundations of ML, Statistical Methods, Deep Reinforcement Learning, Probabilistic Graphical Models, Deep Learning, Computer Vision, Data Structures & Algorithms, Operating Systems, Computer Networks, DBMS

Experience

Microsoft — Jul 2023 – Present
Software Engineer — *New Delhi, India*

- Root-causing Azure customer incidents took days; built a multi-agentic **root cause analysis (RCA) agent** on Copilot cutting it to **hours**. Won **3rd place** at Microsoft's **Global Hackathon** for a Copilot–SAP workloads integration.
- Independently owned an **Azure Portal** feature showcased at **Microsoft Ignite** (**Resource Graph**-based resource discovery), built from scratch in **React.js**, from UI design to customer release, across design, PM and partner teams.
- To let **5 AI agents** coordinate workload onboarding to Azure, implemented **agent-to-agent (A2A)** communication end-to-end (**C#** server APIs, **Python** clients on the A2A SDKs), now powering onboarding for **100+ enterprise customers**.
- Built **LLM evaluation pipelines** on **Azure AI Foundry** for security reviews; prototyped **Semantic Kernel** and **MCP** agents.
- Took a production Azure service from **50+ open security vulnerabilities** to **full compliance** via SDK, dependency and infra upgrades; replaced password auth with **Managed Identity** and **least-privilege RBAC**, eliminating all stored credentials.
- A mission-critical B2B telemetry platform serving **200+ Azure customers** needed secure client auth; designed and built a **certificate-based authentication system** from scratch, running with **zero production incidents** since its 2025 launch.
- Built **C#** backend APIs from scratch for lifecycle features (start/stop, deletion) in Azure Center for SAP Solutions [product], with automated tests, and independently rolled the service out to **20+ Azure regions** via Azure DevOps.
- Built observability tooling (alerts, dashboards, **KQL** diagnostics) used by on-call engineers to triage production issues.

Microsoft — May 2022 – Jul 2022
Software Engineer Intern — *Hyderabad, India*

- Training a random-forest SLA decomposition model from an MSR/IEEE paper [paper] was slow on **100+ GB** datasets; cut training time and memory by **75%** via time profiling, vectorization and leaner logging.
- Built a distributed ML proof of concept with **PySpark** and **Databricks** for scalable preprocessing and training on large datasets.

Wunderman Thompson (Salmon) — May 2021 – Jul 2021
Machine Learning Intern — *New Delhi, India*

- Built a next-basket **recommender** in **PyTorch** (DREAM model) with RNNs, pooling and dynamic user representations.

Achievements

- **JEE 2019:** Advanced 99.7 percentile; Main AIR 3366 (99.73 percentile, ∼1M candidates)
- **NTSE Scholar (2017):** Govt. of India's National Talent Search Exam (logical reasoning, maths, social sciences); top 0.2%
- **LeetCode:** 800+ problems solved (Easy: 255, Medium: 467, Hard: 85)
- **Dean's Award:** Excellence in Teaching Assistantship, Data Structures & Algorithms
- **Google Cloud Facilitator:** enabled 200+ students to complete 80+ hours of GCP/ML labs

Publications

Erasing Labor with Labor: Dark Patterns and Lockstep Behaviors on Google Play [paper]
Co-author – ACM Conference on Hypertext and Social Media (HT '22), 2022

- Built a dataset of **319K reviews** across 60 apps (**160.5M+ installs**) via large-scale scraping; adapted a state-of-the-art **microcluster anomaly detection** algorithm to surface coordinated (lockstep) review behaviour.
